

STRENGTHEN YOUR STRUCTURE

Distribution Management, Inc.

Project Description

7,500 square feet of the total floor slab area, including the lobby, main hallways and staircase was designed to have a reactive stain finish with grouted saw cuts between each of the four stain colors. The work was scheduled to begin after the drywall was in place.

the geometric floor pattern required precise layout and execution of saw cuts. Dealing with multiple stain colors, it also required precise application procedures in order to prevent one stain from bleeding over into the adjacent color. This was most crucial where the reactive stains were brought to a narrow point.
