

STRENGTHEN YOUR STRUCTURE

Private Business, Fenton MO

Project Description

The site design for this rambling hilltop corporate campus utilized a creative medley of plain and colored concrete in a bold geometric pattern. The project is comprised of three (3) areas: The front gate drive, the porte-cochere drive and walk, and the park patios. All three areas total 27,000 square feet and involve combinations of plain and integrally colored concrete that required accurate layout and formwork. For consistent color between the loads, it was critical for the ready-mix supplier to deliver each load with the same water/cement ratio. A painstaking effort was made during the layout phase to ensure that the bold intent of the geometric design carried through to the installation. This required pulling string lines of great length in order to set the radius points precisely. The consistency and precision of the broom finish indicates the dedication of the crew to achieving the highest quality workmanship.
